

Lecture 5: Embedded Software Architecture

Seyed-Hosein Attarzadeh-Niaki

Some Slides due to Philip Koopman and Marilyn Wolf

Review

- Modeling physical dynamics
- Actor-based modeling of continuous-time systems
- Control systems

- High Level Design (HLD) = architecture (nouns) + requirements (verbs)

- ## Embedded Real-Time Systems

Simplified Architecture: Boxes and Arrows

- Software architecture shows the big picture
 - **Boxes**: software modules/objects
 - **Arrows**: interfaces
 - Box and arrow semantics well-defined
 - Meaning of box/arrow depends on goal
 - Components all on a single page
 - Nesting of diagrams is OK
- Many different architecture diagrams are possible, such as
 - *Software architecture* (components and data flow types)
 - *Hardware architecture* with software allocation
 - *Controls architecture* showing hierarchical control
 - *Call graph* showing run-time hierarchy

Embedded Real-Time Systems

5

Example: GPS Moving Map Requirements

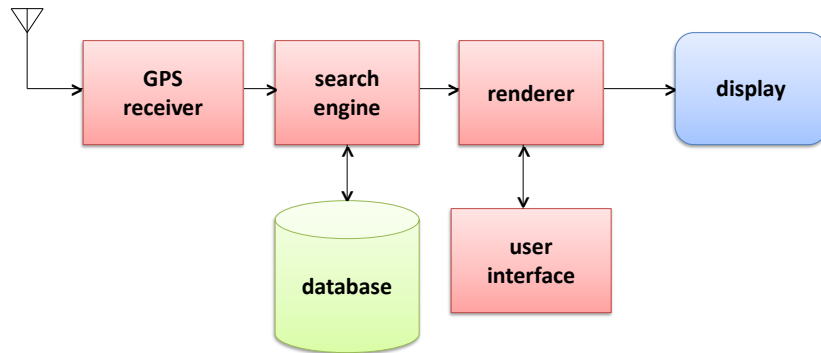

- Moving map obtains position from GPS, paints map from local database.
- **Functionality**: For automotive use. Show major roads and landmarks.
- **User interface**: At least 400 x 600 pixel screen. Three buttons max. Pop-up menu.
- **Performance**: Map should scroll smoothly. No more than 1 sec power-up. Lock onto GPS within 15 seconds.
- **Cost**: \$120 street price = approx. \$30 cost of goods sold.
- **Physical size/weight**: Should fit in hand.
- **Power consumption**: Should run for 8 hours on four AA batteries.

GPS Moving Map Software Architecture

What about the
interfaces?

Embedded Real-Time Systems

9

Example System: Soda Vending Machine

- High Level Requirements
 - Make it work like a real vending machine
- Simplification
 - Sodas cost some number of quarters
 - All other coins are rejected (invisible to your control system)
- Assume a Distributed System per given diagram
 - Processor for each button, coin return controller, vending controller
 - You get the message dictionary and most of the requirements specification (the “Architecture”)

Embedded Real-Time Systems

10

UML Use Cases for Requirements Development

- Actor is a person
- Actor initiates a Use Case
- Represents the system from the actor's point of view
- Use cases are independent ("transactions")

Embedded Real-Time Systems

11

System-Level Text Requirements

- Goal: implement a soda vending machine
 - R1. Pushing a button **shall** vend a soda of the type corresponding to that button.
 - R2. The machine **shall** permanently retain exactly SODACOST coins for each can of soda vended.
 - R3. Coin return **shall** return all deposited coins since the last vend cycle.
 - R4. The machine **shall** return all deposited money in excess of SODACOST coins before a vend cycle.
 - R5. The machine **shall** flash the light for a selected item while vending is in progress to indicate acceptance of a selection to the buyer.
 - R6. The machine **shall** illuminate the light for any out-of-stock item
- Assume a Fully Distributed System
 - Processor for each button, coin return controller, vending controller

Embedded Real-Time Systems

12

Traceability: UML & Text Requirements

	Text Requirements					
Use Cases	R1	R2	R3	R4	R5	R6
U1. Customer inserts a quarter				X		
U2. Customer pushes a soda button	X				X	
U3. Customer pushes coin return button			X			
U4. Observe soda availability						X
U5. Collect money		X				
U6. Refill machine		X				X

Vending Machine Architecture Diagram

(revised 2010-01-17)

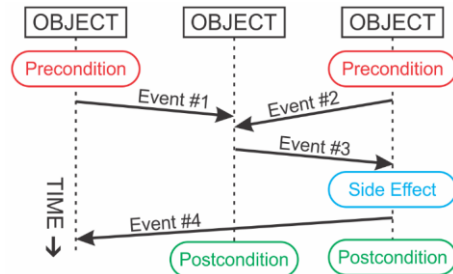

Legend: Blue = physical objects / Black = microcontrollers with software

Embedded Real-Time Systems

14

Sequence Diagram (SD) as A High-Level Design (HLD) Notation

- SD construction
 - Each **object** has a time column extending downward
 - **Arcs** are interactions between objects
- Each SD shows a **scenario**
 - Top ovals are *preconditions*
 - Middle ovals are *side effects*
 - Bottom ovals are *postconditions*
- SD is a *partial* behavioral description for objects
 - Generally, each object participates in multiple SDs; each SD only has some objects
 - The set of all SDs forms the HLD for all objects in the system

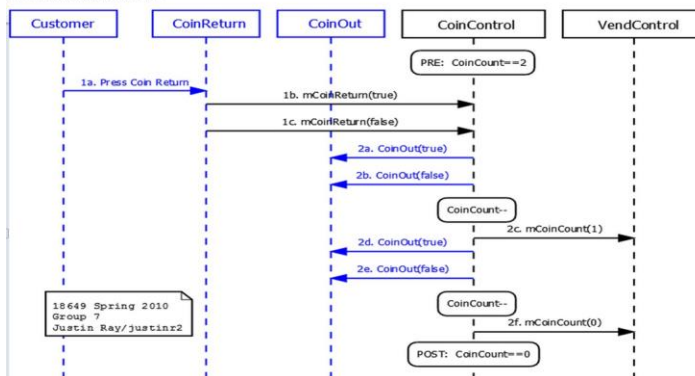

Embedded Real-Time Systems

15

Example

Sequence Diagram 3A:

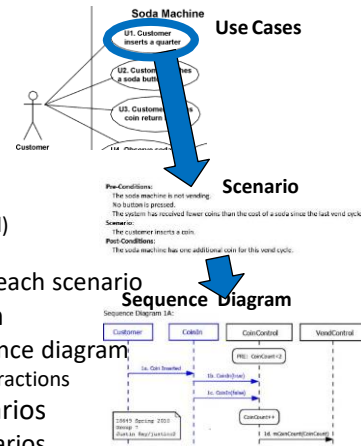

Legend: **Blue** = physical objects / **Black** = microcontrollers with software
 PRE = precondition / POST = postcondition / other ovals are side effects

Embedded Real-Time Systems

16

Use Cases to Sequence Diagrams

- Use Case diagram – types of interactions
 - System has multiple use cases
 - Example: Use Case #1: Insert a coin
- Scenario – a specific variant of a use case
 - Each use case has one or more scenarios
 - Scenario 1.1: insert coin to add money
 - Scenario 1.2: insert excess coin (too many inserted)
 - Scenario 1.3: ... some other situation...
 - Interactions between objects are different for each scenario
- Sequence Diagram – a specific scenario design
 - For our purposes each scenario has one sequence diagram
 - Sequence diagrams 1.1, 1.2, 1.3 show specific interactions
- Statechart – design that incorporates all scenarios
 - One StateChart per object, addressing all scenarios

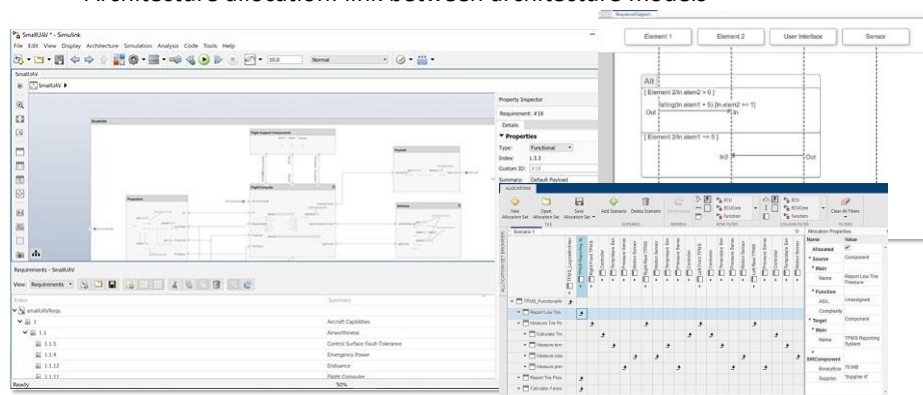

Embedded Real-Time Systems

17

MATLAB System Composer

- Compose a hierarchical block diagram of the system/software architecture
- Specify and refine interfaces on ports
- Requirements allocation and analysis
- Behavioral modeling using block diagrams, state charts and SDs
- Architecture allocation: link between architecture models

Embedded Real-Time Systems

18

High Level Design (HLD) Best Practices

- HLD includes
 - One or more architecture diagrams
 - Defines all components & interfaces
 - HW arch., SW arch., Network arch., ...
 - Sequence Diagrams
 - Both nominal and off-nominal interactions
 - HLD must co-evolve with requirements
 - Need both nouns + verbs to define a system!
- High Level Design pitfalls
 - Diagrams that leave out interactions
 - Boxes and arrows don't have well defined meanings
 - HLD that bleeds into detailed design information
 - Should have separate Detailed Design per component
